

Exam Prep AI - Revision Plan

Generated on 08 June 2026

Based on the provided information, here's the classification of topics into high, medium, and low priority categories:

High Priority Topics:

1. Algorithmic thinking
2. Recursion
3. Dynamic programming
4. Greedy algorithm
5. Randomized approach
6. Python programming (variables, data types, operators, functions)
7. Backtracking
8. Means-Ends Analysis
9. Memoization and tabulation
10. Heuristics approach

These topics are highly emphasized in the syllabus and have a high weightage in the exam. They are also frequently appearing in the past year questions.

Medium Priority Topics:

1. Pseudocode and flowchart representation
2. Computational approaches (brute-force, divide-and-conquer)
3. Selection and iteration using Python
4. Decomposition and modularization
5. Flowcharts
6. Problem-solving strategies
7. Task scheduling
8. LCM calculation
9. GCD calculation
10. Search algorithm

These topics are important but not as highly emphasized as the high priority topics. They are still considered crucial and need to be studied thoroughly.

Low Priority Topics:

1. Strings and string operations
2. Fibonacci sequence generation
3. Palindrome checking
4. Sudoku solving

5. Password recovery
6. Grading system
7. Delivery times filtering
8. Largest and smallest numbers
9. Factorial calculation
10. Triangle classification

These topics are less emphasized in the syllabus and have a lower weightage in the exam. However, they still need to be studied to ensure a good understanding of the subject.

Day-wise Hourly Revision Schedule:

Day 1-3: High Priority Topics (9 hours/day)

- Day 1: Algorithmic thinking (3 hours), Recursion (3 hours), Python programming (3 hours)
- Day 2: Dynamic programming (3 hours), Greedy algorithm (3 hours), Randomized approach (3 hours)
- Day 3: Backtracking (3 hours), Means-Ends Analysis (3 hours), Memoization and tabulation (3 hours)

Day 4-6: Medium Priority Topics (9 hours/day)

- Day 4: Pseudocode and flowchart representation (3 hours), Computational approaches (3 hours), Selection and iteration using Python (3 hours)
- Day 5: Decomposition and modularization (3 hours), Flowcharts (3 hours), Problem-solving strategies (3 hours)
- Day 6: Task scheduling (3 hours), LCM calculation (3 hours), GCD calculation (3 hours)

Day 7-9: Low Priority Topics (9 hours/day)

- Day 7: Strings and string operations (3 hours), Fibonacci sequence generation (3 hours), Palindrome checking (3 hours)
- Day 8: Sudoku solving (3 hours), Password recovery (3 hours), Grading system (3 hours)
- Day 9: Delivery times filtering (3 hours), Largest and smallest numbers (3 hours), Factorial calculation (3 hours)

Day 10-12: Revision of all topics (9 hours/day)

- Day 10: Revision of high priority topics (3 hours), revision of medium priority topics (3 hours), revision of low priority topics (3 hours)
- Day 11: Revision of high priority topics (3 hours), revision of medium priority topics (3 hours), revision of low priority topics (3 hours)
- Day 12: Revision of all topics (9 hours)

Final Revision Phase:

Day 13-15: Final revision of all topics (9 hours/day)

- Day 13: Final revision of high priority topics (3 hours), final revision of medium priority topics (3 hours), final revision of low priority topics (3 hours)

- Day 14: Final revision of high priority topics (3 hours), final revision of medium priority topics (3 hours), final revision of low priority topics (3 hours)
- Day 15: Final revision of all topics (9 hours)

This schedule is tailored to the student's learning style and should be adjusted accordingly. It's essential to take breaks and practice problems throughout the day to ensure a thorough understanding of the subject.
